Disaster Recovery for Mission-Critical Operations

Companies with mission-critical applications or IT operations know they have to be prepared for hardware failure or loss of access to their information. Disasters can take many forms and are a constant threat to your business. It is vital to ensure disaster recovery and business continuity plans are in place to bring your company back online as quickly as possible in an emergency. After all, the cost of preparing for and mitigating risk is far less than the cost of attempting to recover from a disaster. An unplanned loss of service can mean lost business, lost customers and most importantly, lost data, all of which can be detrimental to the future of your business. Preparation and testing are key to your success.

BlueBridge Networks recognizes that IT departments are under increased pressure to face these challenges of optimizing business continuity and availability. IT organizations must meet recovery objectives, protect data, and make it available 24/7. In addition, IT is tasked with managing outdated infrastructures, while working with limited resources and tight budgets.

BlueBridge Networks delivers a comprehensive range of maintenance support services for your unique business requirements and framework. We can identify risk, assess the potential impact and then make specific recommendations to remove or mitigate the risk. We have the proven expertise, methodologies, facility and expert staff to rapidly rectify any service interruption, minimizing costs and ensuring business continuity.

Disaster Recovery Secondary Sites – Your Back-Up Plan

Secondary sites can play a big part in your disaster recovery strategy. By implementing a secondary data center away from the primary data site, you can minimize the possibility of both facilities being simultaneously compromised. BlueBridge Networks' Secondary Site program offers the latest technology to ensure that your data is safe all the time, even when disaster strikes.

BlueBridge Networks' advanced technology notification and reporting capabilities can pinpoint when an outage occurs and immediately notify your administrators of the problem. And our automated approach, such as high-availability solutions, can help eliminate vast amounts of downtime.

BlueBridge Networks delivers real benefits for your business by protecting your revenue, increasing your customer service levels, resolving your service interruptions quickly and ultimately minimizing your downtime.
