

# Managed Security Services

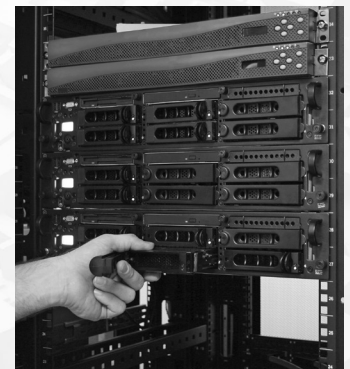

BlueBridge Networks® managed security services delivers high **availability** and **security** for your organization's network

## Service Features

- 24x7x365 Monitoring and Analysis
- Intrusion Detection and Prevention Service
- Security Monitory and Audits
- Virus and Spam Eradication
- Vulnerability Assessments
- Network Design, Implementation, and Support
- Regulatory Compliant Systems
- Virtual Private Networks

BlueBridge Networks' security solutions will take control of who's connecting to your network, making sure that the devices that log on don't pose a danger to your company security and compliance. Our security services protect you from Internet attacks, stopping unauthorized access and preventing worms, trojans, and viruses from taking down your network. We can help your organization save money and reduce risk.

A popular misconception many companies have is that a firewall will adequately protect a network from hackers and exploitation. In fact, firewalls represent only one of the seven elements needed for a layered defense and prudent network security regimen. Beyond a firewall, most network security experts also advise creating a security policy specific to your organization, host system security, auditing, router security, intrusion detection and prevention systems (IDS/IPS) and an incident response plan (IRP).

BlueBridge Networks offers fully comprehensive managed security services, from managed firewall and intrusion prevention, to content filtering, spam filtering, vulnerability management, virtual private network (VPN) services and more:

- **Managed Routers and Firewalls:** Monitoring security, health and performance of your router, firewall and/or firewall cluster. These services ensure the highest level of security by tracking, controlling, and alerting all the flows of communication to minimize any malicious activity.
- **Intrusion Detection and Prevention System (IDS/IPS):** This system is responsible for detecting anomalous, inappropriate or other data that may be considered unauthorized on your network - a vital element in any network security plan. BlueBridge Networks' specialists monitor network activity and issue alerts to identify any security threats or possible vulnerabilities.
- **Virtual Private Network (VPN):** An alternative to a dedicated, leased access line, a VPN uses virtual connections routed through the Internet from your organization's network to connect remote sites or employees.

We provide the comprehensive managed security services you need to constantly monitor and manage network activity and identify suspicious patterns that may indicate a network or system attack.
